What is AI and ML?

What exactly is machine learning and artificial intelligence?

The word "AI" is often used quite loosely:

To briefly explain how Linear Regression helped us reverse engineer the BSR equation, let's break it down. Linear Regression is an AI equation that finds the proper coefficients for an equation by sorting through massive amounts of data. The equation looks something like $BSR = X(a) + Y(b) + Z(c).....$ and so and so forth.

Artificial intelligence (AI), sometimes called machine intelligence, is intelligence demonstrated by machines, unlike the natural intelligence displayed by humans and animals. – Wikipedia

Artificial intelligence (AI), the ability of a digital computer or computer-controlled robot to perform tasks commonly associated with intelligent beings. – Encyclopedia Britannica

What is Artificial General Intelligence?

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Artificial general intelligence (AGI) is the hypothetical intelligence of a machine that has the capacity to understand or learn any intellectual task that a human being can. – Wikipedia

Also called:

1. Strong AI
2. General AI
3. Full AI

Machine Learning is the field of study that gives the computer the ability to learn without being explicitly programmed. – Arthur Samuel (1959)

A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P , if its performance at tasks in T , as measured by P , improves with experience E . – Tom Mitchell (1998)

Learning from data. – Hastie, Tibshirani, Friedman (2009)

Figure: A new paradigm? (Chollet, 2018, Figure 1.2)

Figure: Regression vs. Pure Predictions (Efron, 2020, Table 5)

Table 5. A comparison checklist of differences between traditional regression methods and pure prediction algorithms.

	Traditional regressions methods	Pure prediction algorithms
1.	Surface plus noise models (continuous, smooth)	Direct prediction (possibly discrete, jagged)
2.	Scientific truth (long-term)	Empirical prediction accuracy (possibly short-term)
3.	Parametric modeling (causality)	Nonparametric (black box)
4.	Parsimonious modeling (researchers choose covariates)	Anti-parsimony (algorithm chooses predictors)
5.	$\mathbf{x} \ p \times n$: with $p \ll n$ (homogeneous data)	$p \gg n$, both possibly enormous (mixed data)
6.	Theory of optimal inference (mle, Neyman–Pearson)	Training/test paradigm (Common Task Framework)

Course information

UPPSALA
UNIVERSITET

Course information

The aims of this course are that you should:

- What is AI and ML?
- **Course information**
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

1. get a good knowledge of a large number of machine learning models,
2. become able to use methods for evaluating and improving predictive models,
3. become able to handle big data,
4. become able to train and use machine learning models in R,
5. become able to train and use neural networks using Keras/TensorFlow.
6. become able to describe and discuss ethical aspects of big data and black box-models,

UPPSALA
UNIVERSITET

Course Outline

Two main parts:

- What is AI and ML?
- **Course information**
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning
- Core Content (8 lecture blocks):
 - Supervised learning (5 blocks)
 - Introduction (1 block)
 - Tree-based methods (1 block)
 - Neural Networks (3 block)
 - Unsupervised learning (2 blocks)
 - Reinforcement learning (1 block)
- Assignments (8 individual assignments)
- Mini-project on a supervised project (2-3 students)

Exact dates and details; see the course page.

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Core Content

- One-two lectures/computer labs (approx. 2-4h)
 - Lecture(s): present overall theory and content (overview)
 - Computer labs(s): Hands on help with the assignment if you get stuck. **Start before the computer assignment!**
- **Ask questions!**
- Online video material and reading assignments (approx. 2-3h, 50-90 pages a week)
- *Note!* There might be some overlap between reading instructions.
- An individual computer assignment (approx. 14-16h). Deadline Sundays 23.59.
- Recommended workflow for each block
 - Do the reading assignments
 - Attend the lecture (optional) **to ask questions!**
 - Watch the videos (although, optional)
 - Do the computer assignment

UPPSALA
UNIVERSITET

Examination

- What is AI and ML?
- **Course information**
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

1. To pass (G): All labs, mini-project, and project review need to be passed (70%)
2. To pass with distinction (VG): 6/10 VG points
3. Each assignment has an extra (VG) task worth 1 VG point.
4. The mini-project is worth 2 VG-points (if it is passed with distinction).
5. Ph.D. students: I suggest you get VG to pass the course. Make the project a potential paper.

UPPSALA
UNIVERSITET

- What is AI and ML?
- **Course information**
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Computer Assignments

1. Main part of the course
Learning by doing
2. Machine learning = Statistics + Computer Science
Hence a lot of programming
3. Both implementation of core components and state-of-the-art methods
4. *Warning!* There might be bugs in the assignments! **Don't hesitate to ask questions!**
5. All assignments can be turned in a three times. 2nd deadline last day of course. 3rd deadline approx 2-4 weeks after the course. **If failed, resubmit right away!**
6. We will mark and return each assignment within 10 working days.
7. *Important!* Don't write your name anywhere and do the assignment evaluation!
8. *Important!* Don't **show your assignment** to any other student. But feel free to discuss!
9. Computer labs:
 - 9.1 First lab each week will include a 15 min introduction
 - 9.2 Our focus: Help during computer labs - less focus on assignment feedback

Figure: Workload last year to pass (G)

Figure: Workload last year to pass with distinction (VG)

Mini-project

- What is AI and ML?
- **Course information**
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- See project instructions on webpage for details.
- **Supervised problem** of choice on real data.
- 2-3 students.
- Supply a half-page project proposal of data and problem at the end of block 6.
- Project will last two weeks (half time) - but start earlier.
- Approximate 40 hours of work *per student*.
- The project should result in a 4 page report (PDF) using the ICML LaTeX template (see course page).
- Project oral presentation (10-15 minutes)

- What is AI and ML?

Supervised learning

Figure: Relationship between apartment size and price ([source](#))

Problem: We want to predict the price of a new apartment.

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Supervised learning

- General problem: We have *training* data

$$\mathbf{d} = \{(y_i, \mathbf{x}_i), i = 1, \dots, n\}.$$

- \mathbf{x}_i = features/input/predictors/features/independent variables
- y_i = labels/output/dependent variable
- We want to *learn* a function $\hat{y} = f(\mathbf{x}_{new})$ with as good performance as possible.
- Regression problems: $y_i \in \mathbb{R}$
- Classification problems: $y_i \in a, b, c, \dots$ where a, b, c, \dots are discrete classes.

Example of supervised problems

- What is AI and ML?
- Course information
- **Introduction to Supervised Learning**
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- Is this e-mail message spam (1) or not (0)?
- Image recognition/classification
- Image object traction (position in a video)
- Will this patient recover from their illness or not?
- Does this fingerprint belong to an employee or not?
- Does this customer have stable finances or not?
- Face recognition
- Is this tumour malign (1) or not (0)?

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

When the y_i in a regression problem is binary (or more generally, categorical), it becomes a **classification problem**.

The question that the model tries to answer is: does this observation belong to class 0 or class 1?

Logistic regression is a workhorse in classification problems.

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Logistic regression

When analysing binary data y_1, \dots, y_N , we usually assume that the Y_i follow binomial (or Bernoulli) distributions.

Assume that Y_1, \dots, Y_N are independent with $Y_i \sim \text{Bernoulli}(\pi_i)$.

$Y_i \in 0, 1$ with success probability π_i and $\mu_i = E(Y_i) = \pi_i$.

- The natural parameter of the binomial distribution is

$$g(\pi_i) = \log \left(\frac{\pi_i}{1 - \pi_i} \right),$$

called the **logit** or **log odds**.

- A GLM using this link function is called **logistic regression**, but other link functions are also often used in practice.

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Logistic regression

There are two equivalent formulas for **logistic regression**:

$$\log \left(\frac{\pi_i}{1 - \pi_i} \right) = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \cdots + \beta_p x_{ip}, \quad i = 1, \dots, N$$

and

$$\pi_i = \frac{\exp \left(\beta_0 + \sum_{j=1}^p \beta_j x_{ij} \right)}{1 + \exp \left(\beta_0 + \sum_{j=1}^p \beta_j x_{ij} \right)}.$$

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- We *train* a logistic regression model using MLE using the training data.
- Our estimation/training output the MLE $\hat{\theta}$
- We then compute $\hat{p}_i = g^{-1}(\hat{\theta}x_{new})$ for a new observation
- We use a **decision rule** to predict value 0 or 1:

$$\hat{y}_i(\hat{p}_i) = \begin{cases} 1, & \text{if } \hat{p}_i \geq 0.5 \\ 0, & \text{otherwise} \end{cases}$$

Logistic regression: Example

Figure: Decision boundry with two covariates (Hastie et al, 2009, Figure 2.1)

An example: Spam and Ham

E-mail Spam

An e-mail provider what to help classify e-mails as spam (1) or ham (0). They have many previous e-mails that customers have already classified as spam, and e-mails people have responded (ham). They want to predict if a new, unseen e-mail is spam or ham.

Section 4

Optimization Algorithms for Machine Learning

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Training of ML algorithms

1. Training is usually done by minimizing the objective/loss/cost function $L(\theta)$ for $\theta \in \mathbf{R}^P$.
2. Example: Logistic regression, here we can use the **negative** log-likelihood as loss function:

$$L(\theta, \mathbf{y}, \mathbf{X}) = -\log \prod_{i=1}^N p_i^{y_i} (1 - p_i)^{1-y_i},$$

where

$$\log \frac{p_i}{1 - p_i} = \mathbf{x}_i \theta,$$

3. In Machine Learning: P and N might be very large...

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Gradient Decent

1. The workhorse of Machine Learning

$$\theta_t = \theta_{t-1} - \eta \nabla L(\theta_{t-1}, \mathbf{X}, \mathbf{y}),$$

where

$$\nabla f(p) = \begin{bmatrix} \frac{\partial f}{\partial x_1}(p) \\ \vdots \\ \frac{\partial f}{\partial x_n}(p) \end{bmatrix}$$

2. $L(\theta)$ needs to be differentiable

Gradient Descent Analogy

Figure: Gradient Descent Analogy ([source](#))

Gradient Descent (cont.)

Figure: Gradient Descent ([source](#))

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Why Gradient Descent?

- What is AI and ML?
 - Course information
 - Introduction to Supervised Learning
 - Example: Logistic regression
 - Optimization Algorithms for Machine Learning
- Gradient Descent is a poor algorithm (Newton's method, Iteratively Reweighted Least Squares are 'better')
 - So why is gradient descent relevant?
 - The two benefits with Gradient Descent:
 1. Only uses the gradient—scales to large P
 2. Can scale to large data with Stochastic Gradient Descent—scales to large N

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

Stochastic Gradient Descent

- Many loss functions (and gradients) are a sum over N observations (e.g. log-likelihoods).
- We can estimate $\nabla L(\theta, X_i, y_i)$ by choosing a random observation (with index i)

$$E(\nabla L(\theta, X_i, y_i)) = \frac{1}{Z} \nabla L(\theta, \mathbf{X}, \mathbf{y}),$$

for some constant Z .

- Think survey sampling – we want to estimate a total.
- This give us the following algorithm:

$$\theta_t = \theta_{t-1} - \eta_t \hat{\nabla} L(\theta_{t-1}, X_i, y_i),$$

where i is random sampled index.

- *Note!*
We need to have an unbiased estimator for $\nabla L(\theta, \mathbf{X}, \mathbf{y})$
- Epochs vs. Iterations

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- Learning rate η_t is important
- We need to reduce η_t over time
- Will it converge to an optimum?
- Robbins–Monro (1951) conditions:
 1. $\eta_t \geq 0 \quad \forall t \geq 0$
 2. $\sum_t^\infty \eta_t = \infty$
 3. $\sum_t^\infty \eta_t^2 < \infty$

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- Can we estimate the gradient better?
- We take a mini-batch of size B :

$$\theta_t = \theta_{t-1} - \eta_t \nabla L(\theta, \mathbf{X}_{(S)_i}, y_{(S)_i}),$$

where $(S)_i$ is a set of random sample (without replacement) indices and $|(S)_i| = B$.

- B is usually set to optimize hardware

- What is AI and ML?
- Course information
- Introduction to Supervised Learning
 - Example: Logistic regression
- Optimization Algorithms for Machine Learning

- SGD can be slow to converge due to 'jumping' behaviour
- Can improve behaviour using the velocity – the rolling mean of gradients
- Additional hyperparameter α to control velocity

$$v_t = \alpha v_{t-1} + \eta_t \hat{\nabla} L(\theta_{t-1}, X_i, y_i),$$

$$\theta_t = \theta_{t-1} - v_t,$$
