  - Estimating the LDA model

Why variational autoencoders and topic models?

- Popular approaches in industry and academia
- Probabilistic methods for unsupervised learning
- Aim of this lecture:
  - Describe the models
  - How to estimate these models
  - Explain what they are used for

UPPSALA UNIVERSITET

- Autoencoders
- The Variational Autoencoder
  - The probabilistic decoder
  - The probabilistic encoder
  - Traing a variational autoencoder
- Probabilistic Topic Models
  - Latent Dirichlet Allocation
  - Estimating the LDA model

Use Cases

- Variational autoencoders: Unsupervised modeling of images
- Topic models: Unsupervised modeling of documents

Use Cases

- Variational autoencoders: Unsupervised modeling of images
- Topic models: Unsupervised modeling of documents
- Used for:
  - Identify "closeness" in high-dimensional data

Autoencoder

- An autoencoder is a neural network (e.g. feed-forward) that take an input x and predict (the same) x.

Autoencoder

- An autoencoder is a neural network (e.g. feed-forward) that take an input x and predict (the same) x.
- Three parts:
  - encoder $f(x)$ (or $e(x)$)
  - code
  - decoder $g(h)$ (or $d(z)$)

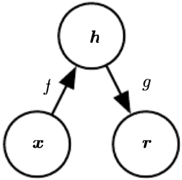

Figure: A Neural Autoencoder (Goodfellow et al, 2018)

Autoencoder

- An autoencoder is a neural network (e.g. feed-forward) that take an input x and predict (the same) x.
- Three parts:
  - encoder $f(x)$ (or $e(x)$)
  - code
  - decoder $g(h)$ (or $d(z)$)

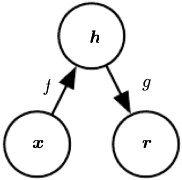

Figure: A Neural Autoencoder (Goodfellow et al, 2018)

- Loss function (reconstruction error):

$$L(\phi, \theta) = (x - d_\phi(e_\theta(x)))^2$$

The Undercomplete Autoencoder

- More interesting: an undercomplete autoencoder: Dimension of code is lower than that of x

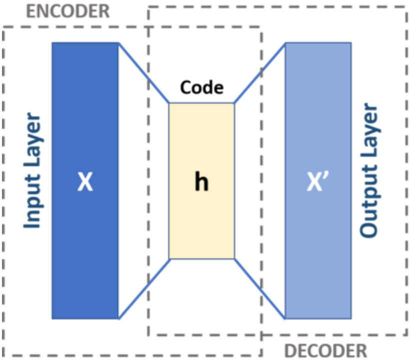

Figure: A Neural Autoencoder (Wikipedia)

PCA and autoencoders

- A linear autoencoder: $e_\theta(x) = W_\phi$, and $d_\theta(x) = W_\phi$
- We want to minimize the loss:

$$L(\phi, \theta) = \sum_{i=1}^{N} (x_i - W_\theta W_\phi x_i)^2$$

PCA and autoencoders

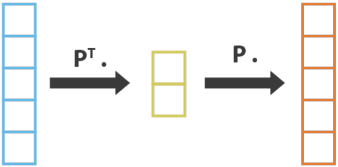
- A linear autoencoder: $e_\theta(x) = W_\phi$, and $d_\theta(x) = W_\phi$
- We want to minimize the loss:

$$L(\phi, \theta) = \sum_{i=1}^{N} (x_i - W_\theta W_\phi x_i)^2$$

- Remember PCA loss:

$$L(P) = \sum_{i=1}^{N} (x_i - P_q P_q^T x_i)^2 ,$$

where P is an orthogonal matrix of rank q.
- Hence: PCA can be seen as an autoencoder



Deep Autoencoders

- Deep Autoencoder: An autoencoder with multilayer neural networks as encoder and decoder
  - can be seen as a non-linear PCA
  - learn nonlinear representations

Deep Autoencoders

- Deep Autoencoder: An autoencoder with multilayer neural networks as encoder and decoder
  - can be seen as a non-linear PCA
  - learn nonlinear representations
- Problem: Deep autoencoders needs to be regularized to not overfit the latent state

UPPSALA UNIVERSITET

  - Estimating the LDA model

probabilistic PCA as an decoder

- Problem: Autoencoders (as PCA) are not probabilistic models:
  - cannot generate data.
  - no notion of uncertainty
- We would like something like probabilistic PCA for (deep) autoencoders

probabilistic PCA as an decoder

- Problem: Autoencoders (as PCA) are not probabilistic models:
  - cannot generate data.
  - no notion of uncertainty
- We would like something like probabilistic PCA for (deep) autoencoders
- Remember the pPCA model (with z as latent variable):

$$x_i \sim N(b + W z_i^T, \sigma I)$$

probabilistic PCA as an decoder

- Problem: Autoencoders (as PCA) are not probabilistic models:
  - cannot generate data.
  - no notion of uncertainty
- We would like something like probabilistic PCA for (deep) autoencoders
- Remember the pPCA model (with z as latent variable):

$$x_i \sim N(b + W z_i^T, \sigma I)$$

- Now, swap the simple parameters with a neural network

$$x_i \sim N(\text{NeuralNetwork}_\phi(z_i), \sigma I)$$

probabilistic PCA as an decoder

- Problem: Autoencoders (as PCA) are not probabilistic models:
  - cannot generate data.
  - no notion of uncertainty
- We would like something like probabilistic PCA for (deep) autoencoders
- Remember the pPCA model (with z as latent variable):

$$x_i \sim N(b + W z_i^T, \sigma I)$$

- Now, swap the simple parameters with a neural network

$$x_i \sim N(\text{NeuralNetwork}_\phi(z_i), \sigma I)$$

- This is an example of a Deep Latent Variable model (a probabilistic decoder)
- Another example is the Variational Autoencoder

The Variational Autoencoder

- The variational autoencoder (VAE) is a deep probabilistic autoencoder
- Commonly used for unsupervised learning of images

The Variational Autoencoder

- The variational autoencoder (VAE) is a deep probabilistic autoencoder
- Commonly used for unsupervised learning of images
- Consists of three parts:
  1. The (probabilistic) encoder $q(z|\phi, x)$: inference model
  2. Sample z from encoded x
  3. The (probabilistic) decoder $p(x|\theta, z)$: observation model

UPPSALA UNIVERSITET

The Variational Autoencoder

- The variational autoencoder (VAE) is a deep probabilistic autoencoder
- Commonly used for unsupervised learning of images
- Consists of three parts:
  1. The (probabilistic) encoder $q(z|\phi, x)$: inference model
  2. Sample z from encoded x
  3. The (probabilistic) decoder $p(x|\theta, z)$: observation model
- Encoding the latent state as a distribution forces the space to be "reasonable"/reduces overfitting

The Variational Autoencoder

- The variational autoencoder (VAE) is a deep probabilistic autoencoder
- Commonly used for unsupervised learning of images
- Consists of three parts:
  1. The (probabilistic) encoder $q(z|\phi, x)$: inference model
  2. Sample z from encoded x
  3. The (probabilistic) decoder $p(x|\theta, z)$: observation model
- Encoding the latent state as a distribution forces the space to be "reasonable"/reduces overfitting
- VAEs get their name from variational inference (used in training)

The Variational Autoencoder

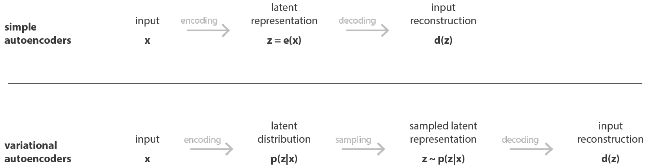

Figure: Autoencoder vs. the Variational Autoencoder (Rocca, 2019)

The Variational Autoencoder

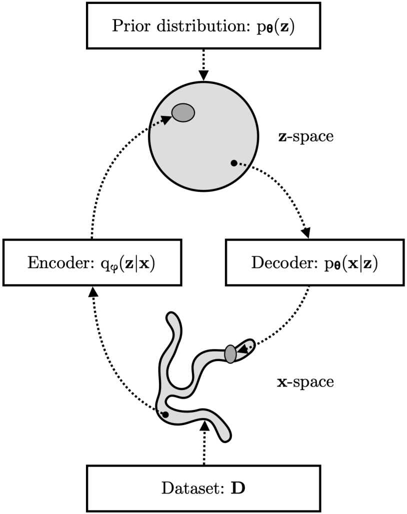

Figure: The Variational Autoencoder (Kingma and Welling, 2018, Fig. 2.1)

The probabilistic decoder

- The probabilistic decoder $p(x|\theta, z)$ (observation model)
- Usually a Normal distribution:

$$x_i \sim N(\text{NeuralNetwork}(z, \theta), cI)$$

- x_i for observation i depends non-linearly on z_i
- A probabilistic linear decoder: pPCA

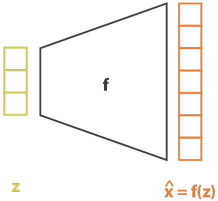

Figure: The Decoder (Rocca, 2019)

The probabilistic encoder

- The probabilistic encoder $q(z|x, \phi)$ (inference model)
- We want: $q_\phi(z|x) \approx p_\theta(z|x)$

The probabilistic encoder

- The probabilistic encoder $q(z|x, \phi)$ (inference model)
- We want: $q_\phi(z|x) \approx p_\theta(z|x)$
- We assume that $q_\phi(z|x)$ follows a specific distribution. Commonly:

$$z \sim N(\mu, \Sigma)$$

- A neural network learns the parameters μ and Σ

$$\mu = \text{NeuralNetwork}(x, \phi_\mu)\,, \Sigma = \text{NeuralNetwork}(x, \phi_\Sigma)\,,$$

where $\phi = (\phi_\mu, \phi_\Sigma)$

The Variational Autoencoder

Figure: The Variational Autoencoder (Kingma and Welling, 2018, Fig. 2.1)

Training a VAE

- Goal: estimating ϕ, θ (and z_i)
- The encoder and decoder are (usually) complicated (no close form solution)
- Need to estimate ϕ and θ using gradient ascent
- Target:
  - Maximize $\log p(x)$
    (Explain the data as well as possible)

Training a VAE

- Goal: estimating ϕ, θ (and z_i)
- The encoder and decoder are (usually) complicated (no close form solution)
- Need to estimate ϕ and θ using gradient ascent
- Target:
  - Maximize $\log p(x)$
    (Explain the data as well as possible)
- Optimization target:
  Maximize the variational lower bound or evidence lower bound (ELBO)

The marginal log-likelihood

$$\begin{aligned}
\log p_\theta(x) &= \int q_\phi(z|x) \log p_\theta(x) dz \\
&= \mathbb{E}_{q_\phi(z|x)}[\log p_\theta(x)] \\
&= \mathbb{E}_{q_\phi(z|x)}\left[\log\left(\frac{p_\theta(x,z)}{p_\theta(z|x)}\right)\right], \text{using } p(z|x) = \frac{p(x,z)}{p(x)} \\
&= \mathbb{E}_{q_\phi(z|x)}\left[\log\left(\frac{p_\theta(x,z)}{q_\phi(z|x)}\frac{q_\phi(z|x)}{p_\theta(z|x)}\right)\right] \\
&= \mathbb{E}_{q_\phi(z|x)}\left[\log\left(\frac{p_\theta(x,z)}{q_\phi(z|x)}\right)\right] + \mathbb{E}_{q_\phi(z|x)}\left[\log\left(\frac{q_\phi(z|x)}{p_\theta(z|x)}\right)\right] \\
&= \underbrace{\mathcal{L}_{\theta,\phi}(x)}_{\text{ELBO}} + D_{KL}(q_\phi(z|x)||p_\theta(z|x))
\end{aligned}$$

  - Latent Dirichlet Allocation
  - Estimating the LDA model

The Kullback-Leibler divergence

- The Kulback-Leibler divergence: a way of measuring the distance between probability distributions (although, not a metric)

$$D_{KL}(q_\phi(z|x)||p_\theta(z|x)) = \mathbb{E}_{q_\phi(z|x)}\left[\log\left(\frac{q_\phi(z|x)}{p_\theta(z|x)}\right)\right]$$

$$D_{KL}(q_\phi(z|x)||p_\theta(z|x)) \geq 0$$

Training target

- Optimization target: Maximize the ELBO

$$\mathcal{L}_{\theta,\phi}(x) = \log p_\theta(x) - D_{KL}(q_\phi(z|x)||p_\theta(z|x))$$

- ELBO is a lower bound for the marginal log-likelihood (similar to the EM algorithm)

Training target

- Optimization target: Maximize the ELBO

$$\mathcal{L}_{\theta,\phi}(x) = \log p_\theta(x) - D_{KL}(q_\phi(z|x)||p_\theta(z|x))$$

- ELBO is a lower bound for the marginal log-likelihood (similar to the EM algorithm)
- Maximizing the ELBO will do two things:
  - Maximize the marginal log-likelihood $\log p_\theta(x)$: Better generative model/decoder
  - Minimize the KL-divergence between $q_\phi(z|x)$ and $p_\theta(z|x)$: Better approximation of the latent space/encoder

UPPSALA UNIVERSITET

Optimizing the ELBO

- Stochastic Gradient *Ascent* to maximize:

$$
\begin{aligned}
\mathcal{L}_{\theta,\phi}(x) &= \sum_{i}^{N} \mathcal{L}_{\theta,\phi}(x_i) \\
&= \sum_{i}^{N} \mathbb{E}_{q_\phi(z_i|x_i)} \left[\log\left(p_\theta(x_i, z_i)\right) - \log(q_\phi(z_i|x_i))\right]
\end{aligned}
$$

- Two problems:
  1. How do we compute the expectation?
     Solution: Monte Carlo Approximation

Optimizing the ELBO

- Stochastic Gradient *Ascent* to maximize:

$$\mathcal{L}_{\theta,\phi}(x) = \sum_{i}^{N} \mathcal{L}_{\theta,\phi}(x_i)$$

$$= \sum_{i}^{N} \mathbb{E}_{q_\phi(z_i|x_i)} \left[\log\left(p_\theta(x_i, z_i)\right) - \log(q_\phi(z_i|x_i))\right]$$

- Two problems:
  1. How do we compute the expectation?
     Solution: Monte Carlo Approximation
  2. How compute the gradient wrt ϕ?
     Solution: Change of variables: $z = g(\epsilon, \phi, x)$
     This is called the reparametrization trick

Optimizing the ELBO

UPPSALA UNIVERSITET

- Autoencoders
- The Variational Autoencoder
  - The probabilistic decoder
  - The probabilistic encoder
  - Traing a variational autoencoder
- Probabilistic Topic Models
  - Latent Dirichlet Allocation
  - Estimating the LDA model

- Using the reparametrization trick and Monte Carlo approximation, we get:

$$\begin{aligned}\mathcal{L}_{\theta,\phi}(x) =&\mathbb{E}_{q_\phi(z|x)}\left[\log\left(p_\theta(x,z)\right) - \log(q_\phi(z|x))\right] \\ =&\mathbb{E}_{p(\epsilon)}\left[\log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\right] \\ \approx&\log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\end{aligned}$$

Optimizing the ELBO

- Using the reparametrization trick and Monte Carlo approximation, we get:

$$\begin{aligned}\mathcal{L}_{\theta,\phi}(x) =& \mathbb{E}_{q_\phi(z|x)}\left[\log\left(p_\theta(x,z)\right) - \log(q_\phi(z|x))\right]\\ =& \mathbb{E}_{p(\epsilon)}\left[\log\left(p_\theta(x,g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\right]\\ \approx& \log\left(p_\theta(x,g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\end{aligned}$$

- A common approach: do the MC approximation with only one sample per datapoint x_i.

Optimizing the ELBO

- Using the reparametrization trick and Monte Carlo approximation, we get:

$$\begin{aligned}\mathcal{L}_{\theta,\phi}(x) =& \mathbb{E}_{q_\phi(z|x)}\left[\log\left(p_\theta(x,z)\right) - \log(q_\phi(z|x))\right] \\ =& \mathbb{E}_{p(\epsilon)}\left[\log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\right] \\ \approx& \log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\end{aligned}$$

- A common approach: do the MC approximation with only one sample per datapoint x_i.
- We approximate both $\mathcal{L}_{\theta,\phi}(x)$ and $\nabla\mathcal{L}_{\theta,\phi}(x)$

Optimizing the ELBO

- Autoencoders
- The Variational Autoencoder
  - The probabilistic decoder
  - The probabilistic encoder
  - Traing a variational autoencoder
- Probabilistic Topic Models
  - Latent Dirichlet Allocation
  - Estimating the LDA model

- Using the reparametrization trick and Monte Carlo approximation, we get:

$$
\begin{aligned}
\mathcal{L}_{\theta,\phi}(x) =& \mathbb{E}_{q_\phi(z|x)}\left[\log\left(p_\theta(x,z)\right) - \log(q_\phi(z|x))\right] \\
=& \mathbb{E}_{p(\epsilon)}\left[\log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))\right] \\
\approx& \log\left(p_\theta(x, g(\epsilon,\phi,x))\right) - \log(q_\phi(g(\epsilon,\phi,x)|x))
\end{aligned}
$$

- A common approach: do the MC approximation with only one sample per datapoint x_i.
- We approximate both $\mathcal{L}_{\theta,\phi}(x)$ and $\nabla\mathcal{L}_{\theta,\phi}(x)$
- Sometimes called a doubly stochastic algorithm.

The Autoencoding Variational Bayes Algorithm

Algorithm 1: Stochastic optimization of the ELBO. Since noise originates from both the minibatch sampling and sampling of $p(\boldsymbol{\epsilon})$, this is a doubly stochastic optimization procedure. We also refer to this procedure as the *Auto-Encoding Variational Bayes* (AEVB) algorithm.

Data:
- $\mathcal{D}$: Dataset
- $q_{\boldsymbol{\phi}}(\mathbf{z}|\mathbf{x})$: Inference model
- $p_{\boldsymbol{\theta}}(\mathbf{x}, \mathbf{z})$: Generative model

Result:
- $\boldsymbol{\theta}, \boldsymbol{\phi}$: Learned parameters

$(\boldsymbol{\theta}, \boldsymbol{\phi}) \leftarrow$ Initialize parameters
while *SGD not converged* **do**
- $\mathcal{M} \sim \mathcal{D}$ (Random minibatch of data)
- $\boldsymbol{\epsilon} \sim p(\boldsymbol{\epsilon})$ (Random noise for every datapoint in $\mathcal{M}$)
- Compute $\tilde{\mathcal{L}}_{\boldsymbol{\theta},\boldsymbol{\phi}}(\mathcal{M}, \boldsymbol{\epsilon})$ and its gradients $\nabla_{\boldsymbol{\theta},\boldsymbol{\phi}}\tilde{\mathcal{L}}_{\boldsymbol{\theta},\boldsymbol{\phi}}(\mathcal{M}, \boldsymbol{\epsilon})$
- Update $\boldsymbol{\theta}$ and $\boldsymbol{\phi}$ using SGD optimizer

end

- A mixed membership model (a mixture of multinomial mixtures model)
- Topic model builds on the the distributional hypothesis

Probabilistic Topic Models

- Unsupervised method for textual data
- Popular in industry and academia to analyze large corpora
- The most common model: Latent Dirichlet Allocation
- A mixed membership model (a mixture of multinomial mixtures model)
- Topic model builds on the the distributional hypothesis
- Use cases:
  - Create features for supervised models

The Dirichlet Distribution

- Probability distribution over the simplex with K categories:

$$f(\mathrm{x}|\boldsymbol{\alpha}) = \frac{1}{\mathrm{B}(\boldsymbol{\alpha})} \prod_{i=1}^{K} x_i^{\alpha_i - 1}$$

where

$$\mathrm{B}(\boldsymbol{\alpha}) = \frac{\prod_{i=1}^{K} \Gamma(\alpha_i)}{\Gamma\left(\sum_{i=1}^{K} \alpha_i\right)},$$

and where

$$\boldsymbol{\alpha} = (\alpha_1, \ldots, \alpha_K)$$

The distributional hypothesis

- Harris (1954) and Firths (1957):
  "Word is characterized by the company it keeps"
- Semantics (broadly defined) is captured by context
- Rough definition: word windows of different sizes

The distributional hypothesis

- Harris (1954) and Firths (1957):
  "Word is characterized by the company it keeps"
- Semantics (broadly defined) is captured by context
- Rough definition: word windows of different sizes
- Different window sizes, different semantic content:
  - Word embeddings (context: word windows)
  - Topic models (context: documents)

Example

1. "A friend in need is a friend indeed."
2. "She is my friend indeed."

Latent Dirichlet Allocation

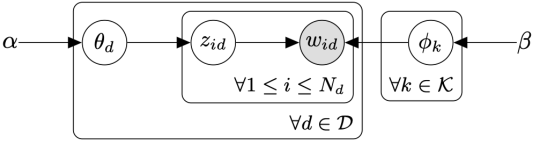

Figure: The Latent Dirichlet Allocation Model

where ϕ_k is the kth row in Φ (of dimension $K \times V$) and θ_d is the dth row in Θ (of dimension $D \times K$).

Generative model for LDA

Relies on the bag-of-word assumption

1. For each component k to K:
   1.1 $\phi_k \sim \text{Dirichlet}(\beta)$
2. For each document d:
   2.1 $\theta_d \sim \text{Dirichlet}(\alpha)$
   2.2 For each token i:
      2.2.1 $z_{id} \sim \text{Categorical}(\theta_d)$
      2.2.2 $w_{id} \sim \text{Categorical}(\phi_{z_{id}})$

Example of parameters z, Θ and Φ

w_1	boat	shore	bank		
z_1	1	1	1		
w_2	Zlatan	boat	shore	money	bank
z_2	2	1	1	3	3
w_3	money	bank	soccer	money	
z_3	3	3	2	3

Closing arguments were heard yesterday in the Federal bankruptcy fraud trial of Stephen J. Sabbeth, whose legal problems have raised doubts about his ability to continue as leader of the Nassau County Democratic Party.

Mr. Sabbeth is charged with trying to conceal $750,000 from his bank creditors by hiding the money in a secret account in his wife's maiden name, rather than use it to pay creditors when his lumber business went into bankruptcy 10 years ago.

Inference

- Common inference approaches
  1. Variational inference
  2. Markov Chain Monte Carlo (MCMC)
- The Gibbs sampler is usually prefered
- Similar to (Stochastic) EM

Gibbs sampler for LDA

The basic Gibbs sampler:

1. We want to estimate z, Φ, Θ:

Gibbs sampler for LDA

The basic Gibbs sampler:

1. We want to estimate z, Φ, Θ:
2. Sample topic indicators (latent variable)

$$p(z = k | \Phi, \Theta) \propto \phi_{v,k}\theta_{k,d}$$

Gibbs sampler for LDA

The basic Gibbs sampler:

1. We want to estimate z, Φ, Θ:
2. Sample topic indicators (latent variable)

$$p(z = k | \Phi, \Theta) \propto \phi_{v,k} \theta_{k,d}$$

3. Sample model parameters

$$\theta_d | \mathrm{z} \sim Dir(\mathrm{n}^{(d)} + \alpha)$$

$$\phi_k | \mathrm{z} \sim Dir(\mathrm{n}^{(v)} + \beta)$$

where $\mathrm{n}^{(d)}$ is the number of tokens by topic in document d and $\mathrm{n}^{(v)}$ is the number of tokens by topic for word type v.

Gibbs sampler for LDA

Integrating out (collapsing) Θ and Φ

$$p(\mathrm{z}|\mathrm{w}) = \int\int p(\mathrm{z}, \Theta, \Phi|\mathrm{w}) \cdot p(\mathrm{z}, \Theta, \Phi) d\Phi d\Theta$$

will result in the following Gibbs sampler:

$$p(z_i = k|w_i, \mathrm{z}_{\neg i}) \propto \underbrace{\frac{n_k^{(v)} + \beta}{n_k^{(v)} + V\beta}}_{type-topic\ (\Phi)} \cdot \underbrace{(n_k^{(d)} + \alpha)}_{topic-doc\ (\Theta)}$$

where $n^{(v)}$ and $n^{(d)}$ are count matrices of size $D \times K$ and $K \times V$.

Example of $n^{(v)}$ and $n^{(d)}$

w_1	boat	shore	bank		
z_1	1	1	1		
w_2	Zlatan	boat	shore	money	bank
z_2	2	1	1	3	3
w_3	money	bank	soccer	money	
z_3	3	3	2	3	

Example of $n^{(v)}$ and $n^{(d)}$

w_1	boat	shore	bank
