General Information

Here general information is included that is needed for administrative/course purposes. Below is a list of the information that needs to be included under general information. **If the information below is missing in the report, the assignment will be failed**.

NOTE! The assignments will be graded anonymously. **Do not include your name anywhere in the assignment! If the name is included, the assignment will be failed.**

- **Time used for reading**: [How long time took the reading assignment (in hours)]
- **Time used for basic assignment**: [How long time took the basic assignment (in hours)]
- **Time used for extra assignment (VG)**: [How long time did the extra (VG) assignments took (in hours)]
- **Good with lab**: [Write one-two sentences of what you liked with the assignment/what should we keep for next year.]
- **Things to improve in the lab**: [Write one-two sentences of what you think can be improved in the assignment. Can something be clarified further? Did you get stuck on stuff that is not related to the content of the assignment etc. If an instruction was unclear, give the question number and briefly explain what was ambiguous.]
- **Anything that was difficult with the material?**: [Was it some part of the material this week that was extra hard to understand/grasp that would need further clarification?]

For every assignment, include one possible oral exam question of your own together with a short model answer. The question should concern this assignment or its associated reading or lectures, be suitable for a 2-4 minute oral answer, and test conceptual understanding rather than only calculation or code. It must not already be in the oral exam question list or be very close to an existing question, for example by only changing numbers.

You are not allowed to use large language models, such as ChatGPT, at all for this oral exam question contribution.

- **Question**: [Write your own oral exam question here.]
- **Short model answer**: [Write your own model answer here.]
- **Permission for future use**: [State **Yes** or **No**: may the course staff use or adapt your question and answer in a future oral exam?]

LLM use and integrity

You may use large language models (LLMs), such as ChatGPT, like you may discuss with fellow students: to learn, ask for explanations, and get feedback. You may not use LLMs to produce the solution you submit. You must be able to explain every part of your own assignment at the oral exam, including your code, results, and reasoning, even when it is not covered by the published oral exam questions. If course staff have concerns about your understanding or the authorship of any part of your submission, you may be asked to explain that part at the oral exam.

Where an exercise explicitly asks you to run an LLM and report its output, you may do so for that experiment. Your explanations and analysis must be your own. This permission does not apply to the oral exam question contribution, for which LLM use is prohibited entirely.

For optional LLM study support, start a new conversation by uploading or pasting the AI tutor instructions and asking the tool to follow them. You may then upload the full **teacher-provided assignment instructions**, including supplied example code. Ask for explanations, incremental hints, and separate practice examples, not completed solutions.

Do not upload your own report, answers, or assessed code. You remain responsible for following the course rules even if the tool offers a solution. Do not ask the tutor to help with the original oral-exam-question contribution, even though its instructions appear in the assignment.

Introduction

This rmd-file is a template with format instructions for Assignments in the Machine learning course at Uppsala University. R markdown is a convenient way of writing exercise reports by combining text and R code using markdown syntax. To create your assignment, remove the formatting instructions, and use this file as a template. Keep the header (the first lines of this file between two lines of —). Set the author name to your name, and set the title to match the assignment number.

R markdown makes it easy to make a structured document with section and subsection titles, textual explanations, equations, code, and figures in a logical order. When you make changes to the code and re-run the notebook or "knit" (render) it to PDF, the relevant code is re-run, and the figures and results are updated without the need to copy and paste (which is prone to errors).

For more information on how to use markdown, see **this** and more details on R markdown can be found **here**.

Also, *R Markdown: The Definite Guide*, a comprehensive book on R Markdown, can be found **here**.

Loading R packages

Below are examples of how to load packages that are used in the assignment

```
library(ggplot2)
```

Including source code

Print the complete definition of every function you implement in the PDF report, including functions in your chosen VG tasks and any helper functions you write. Show each definition once, next to the relevant answer or in a clearly referenced appendix. Function calls, numerical output, and passing `markmyassignment`

(MMA) checks do not replace the function definitions. Keep these definitions visible with `echo = TRUE`; do not hide them with `echo = FALSE` or `include = FALSE`.

Avoid repeating function definitions or printing unrelated exploratory code.

Write clear code. The code is also part of your report, and the clarity of the report affects if you pass the assignment. If the code is not self-explanatory, add comments. In a notebook, you can interleave explaining text and code.

If in doubt, additional source code can be included in an appendix.

Including output

Sometimes, the code can be heavy to run. In those situations it is often much simpler to run the code in ordinary R and the copy the output into markdown. This can be done by simply add the argument `eval=FALSE`.

```
> 1 + 1
[1] 2
```

Format instructions

All exercises in the assignment should start with a header fully specifying that it is exercise X and the question you are answering, as (in rmd use #):

Exercise 1) Describe the concept of machine learning.

Subtasks in each assignment should be numbered and use header (in rmd use ##). Also include the question here. As an example:

a) What is supervised learning?

For each subtask, include a necessary textual explanation, equations, code, and figures so that the answer to the question flows naturally. You can think about what kind of report you would like to review.

Code

We can easily add R code as chunks in the following way:

```
5 + 5
```

```
## [1] 10
```

This R code is evaluated when running the notebook or when rendering to PDF.

If you want to show and run the code, but the output is very long or messy, and you prefer to hide the output from the rendered report, you can use option results='hide'.

```
5 + 5
```

You can exclude unrelated setup or exploratory code from the generated PDF with `include=FALSE`. Do not use this option to hide required function definitions. You will see the next block in rmd, but not in the generated PDF.

Plots

Include plots, where we can specify the width and height of the figure.

```
data("faithful")
plot(faithful$eruptions, faithful$waiting)
```

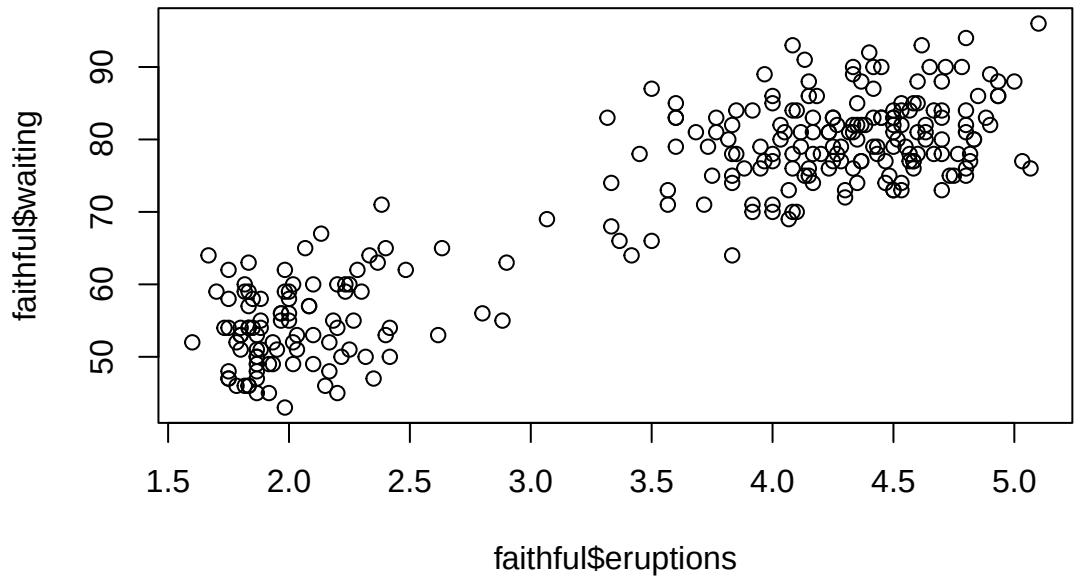

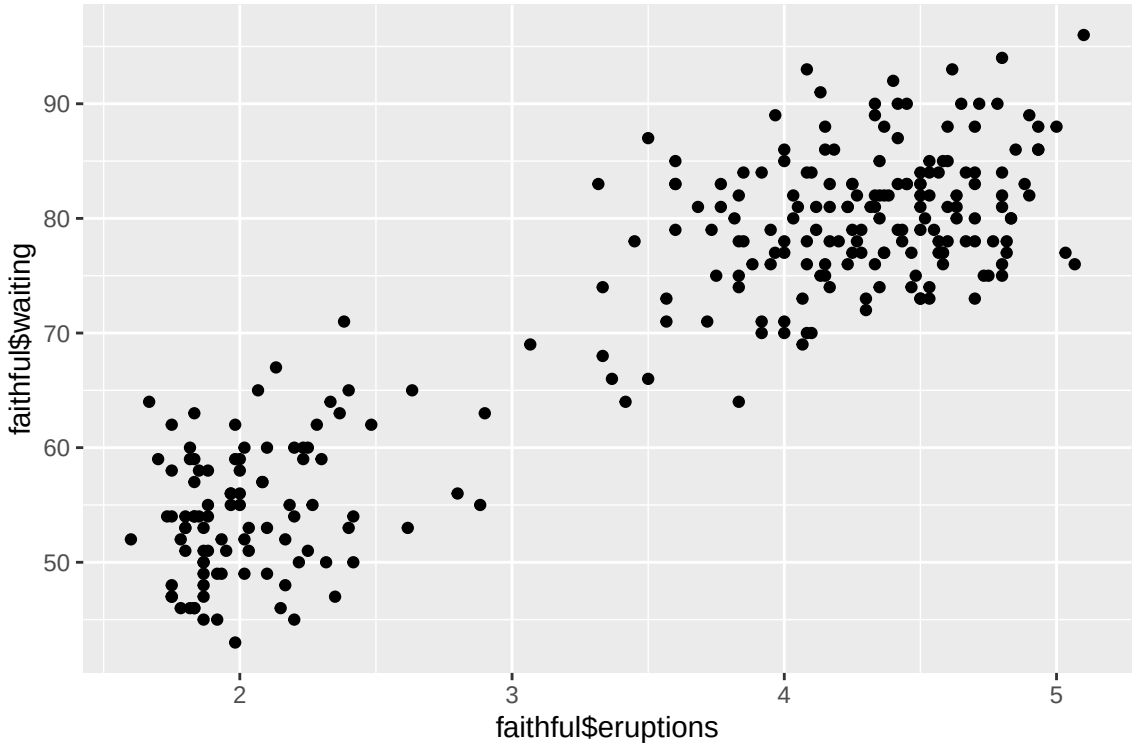

Figure 1: An example Figure.

Or using qplot from ggplot2 package

```
library(ggplot2)
qplot(faithful$eruptions, faithful$waiting)
```

```
## Warning: `qplot()` was deprecated in ggplot2 3.4.0.
## This warning is displayed once per session.
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.
```

Or using ggplot from ggplot2 package

```
ggplot(data=faithful, aes(x=eruptions, y=waiting)) + geom_point() +
  labs(x='Eruption time in mins', y='Waiting time to next eruption (in mins)')
```

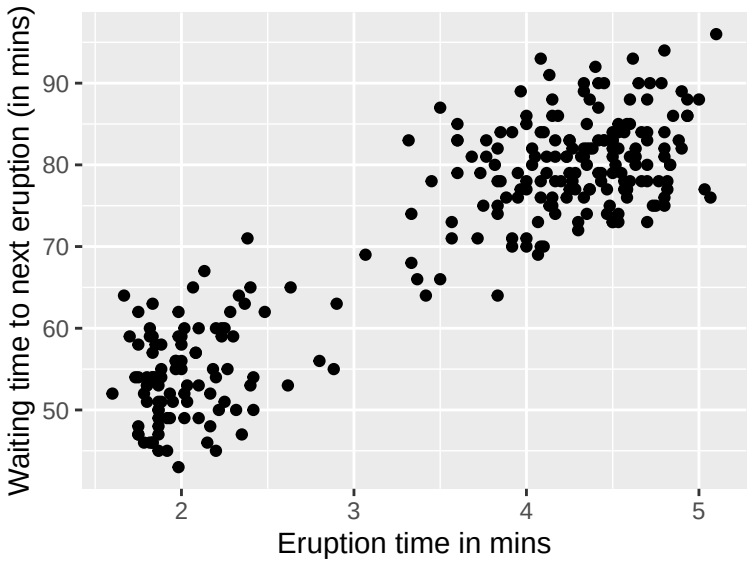

Figure 2: An smaller ggplot2 Figure.

Images

You can include an image as follows

Figure 3: Uppsala University

or alternatively

```
knitr::include_graphics("uu_logo.png")
```

Equations

You should write equations using LaTeX syntax, or you can include them as images if, for example, you use Microsoft Equations.

In Markdown, equations can easily be formulated using LaTeX in line as $f(k) = \binom{n}{k} p^k (1-p)^{n-k}$. Or use the math environment as follows:

$$\begin{matrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23}. \end{matrix}$$

The above example also illustrated multicolumn 'array'. An alternative way to make multiline equations with alignment is to use 'aligned' as follows;

$$\begin{aligned} y &\sim \text{normal}(\mu, 1) \\ \mu &\sim \text{normal}(0, 1). \end{aligned}$$

If you are new to LaTeX equations, you could use the latext4technics equation editor to create LaTeX equations to include in the report.

More information on using LaTeX in R markdown can be found in 2.5.3 in R Markdown: The Definite Guide.

A short introduction to equations in LaTeX can be found here.

Language

The language used in the course is English. Hence the report needs to be written in English.

Jupyter Notebook and other report formats

You are allowed to use any format to produce your report. For example, you can use Jupyter Notebooks, as long as you abide by the instructions in this template.
